

How to repair corrupted sqlite database

Sqlite databases on Android devices are by definition very stable. However we have own experience that databases can be corrupted. This may be due to wrong closing database or kill Locus app. The result is that Locus is not able open the map file or map deletes itself. Luckily sometimes it is possible to repair corrupted database.

How to

Following steps require working with the command line.

- Copy corrupted map file (sqlite database) from your device to PC
- Download sqlite-shell <http://www.sqlite.org/download.html>
- Unpack it and place corrupted database file into the same directory as sqlite3.exe
- Start cmd and navigate to the directory with map file
- Run

```
echo .dump | sqlite3.exe name_of_map.sqlitedb > name_of_map_dump.sql
```

- and then

```
sqlite3.exe -init name_of_map_dump.sql name_of_map_fixed.sqlitedb
```

- Try import fixed map
