

How can Locus Map help me with finding Geocaches?

Geocaching has become a worldwide favourite outdoor game and **Locus Map** is one of the officially certified **Geocaching apps**. It can show you geocaches on the map, navigate you to the cache, display listing, images, logs, it also allows you to log your own findings directly from the app without need to visit Geocaching.com website. And many more, as you can see in the [Geocaching](#) chapter.

There are several methods how to get geocaches into Locus Map and we'll have a look at one of them. Geocaches can be downloaded to your phone by the **Geocaching4Locus** addon which you can easily install for free from the [Google Play Store](#). Once it's done, touch and hold the place on the map where you'd like to see geocaches around. We've done this before when we tried to place a point of interest. When a label with address appears tap it to unfold and select the..... icon. Choose **Nearest caches**. **Locus Map** will ask how many caches you want to download and after the download where to place them. You know already the **Points manager** so use either the existing folder or make a new one to import the caches in. Then you'll be asked for your Geocaching.com login and that's it, geocaches are scattered around the map.
