

How to work with elevation data in Locus?

Concerns Locus Map Pro only

Elevation data are necessary for many aspects of work with Locus:

- base of calculation of route **elevation gain** when [planning](#).
- definition of **elevation of point objects** (POIs, geocaches...)
- database for **dynamic elevation tool** (displays elevation on the position of the map cursor)
- database for rendering **terrain shading**
- filling elevation of imported **Map items** in case the file contains at least one route
- **elevation of routes** calculated by [external navigation engines](#) (BRouter, YOURS, ..)
- **altitude optimization**
- elevation gain displayed with **guiding lines** or lines to GPS location
- database necessary for **pressure sensor calibration**
- calculation of **Trip time**

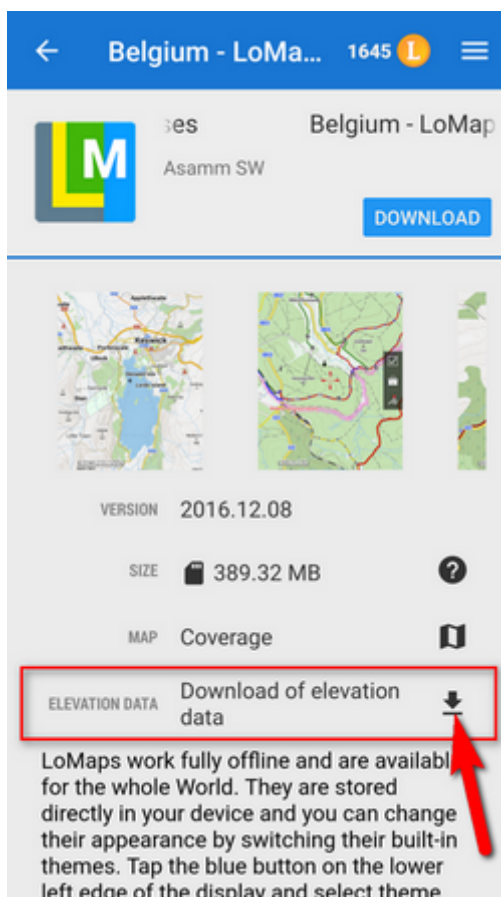

Please do not confuse with **current altitude** that is obtained from GPS data together with values from the barometric pressure meter in your device (if applicable), [see more >>](#). Current altitude values are also used for calculating elevation gain in recorded tracks and are available also for Locus Map Free users.

Where to get them?

In order to use all features above, it is necessary to **download elevation data**. There are a few methods how to get them:

Offline maps

LoMaps and other offline maps from our map partners offered in [Locus Store](#) in packages cover the whole World. **Each map package contains elevation data that can be downloaded separately for free:**

Creating or editing a point of interest

- [Add a new point of interest](#) or open detail screen of an existing point located in the area that we want to cover with elevation data
- find *Elevation* field and if it is empty, tap the button GET next to it

Group of points

- select points (check them) in a desired point folder
- tap  More and  Fill elevation in bottom panel

Track or route

- open a track/route detail screen
- tap  More and  Fill elevation in bottom panel

External websites

- go to some of websites that provide digital elevation data in HGT format, e.g. [here](#):

- select area of map shading and download it
- copy the elevation files to *Locus/data/srtm* directory

Elevation data sources

- [Viewfinderpanoramas.org](https://www.viewfinderpanoramas.org) - SRTM3 data enhanced in mountainous and polar areas. Resolution 3".
- [Open Data Portal](#) - very accurate data obtained from LIDAR mapping missions - covering Austria, Luxembourg, Spain, Slovenia, Northern Italy and part of Germany. Resolution 3".

Map shading

Map or terrain shading serves better readability of the displayed terrain relief. Locus offers three modes:

- **hill shading** - simulating covering of the landscape by sun shade
- **slopes** - highlighting slope gradients of $>30^\circ$, $>35^\circ$ and $>40^\circ$
- **colored elevation** - elevation levels are differed by colors (e.g. lowlands are green, mountains brown).

Instructions

Go to Settings > Maps > Advanced > Map shading > Enable (select which type of map should display the shading)

[More about map shading settings >>](#)
