Update of one app, the other is not installed

Due to the recent changes in the Android file system, it is necessary to **transfer the app data to the private folder** in /Android/data/ directory after the app update. When only a single app is installed on the device (the other Locus is not installed), the data transfer is simple:

- one app (Locus Map 4.4.x or Locus Map Pro 3.55.x) is installed
- download and install Locus Map 4.5 or Locus Map Pro 3.56
- during the app initialization, you are notified of the app directory /Locus/ stored in the unsupported part of the internal storage:
- after accepting it, you can **select the private folder** into which the data will be transferred - either in the **internal storage** or on the **external SD card**
- you can also **merge data from your custom-defined subdirectories**:
- Locus **smoothly transfers all the original data into its private folder**
- the **process may take a few minutes** depending on the size of your data
- after the **app restarts**, all is done and working as before

What if I refuse?

- you can go on using the app as before
- but you are notified of the app data transfer at **each next start of the app**
- you can **move the original data any time** also from the app **main menu**:

  or from *settings* > *miscellaneous* > *default directory*.
