Data Import

About
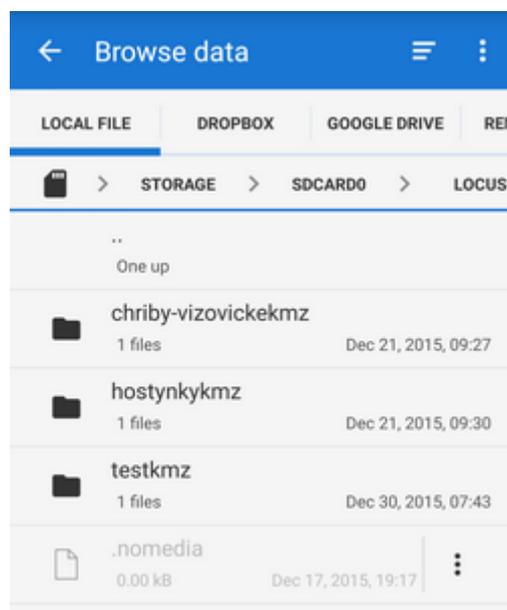

- Menu > More > Data Import

Data import is used when you want to work with **tracks** and **points** from external sources - websites, file folders, databases, applications, add-ons etc. This function is a general place where to start importing. Otherwise there are many other spots where the import can be launched from, depending on the content you want to import - **points** or **tracks**.

Locus Map file manager

When selecting the Data Import function, Locus Map opens a **file manager** window displaying three tabs where to choose files to import. Importable files are in full color and are clickable. More about supported formats see in points/tracks dedicated import chapters.

- **Local file tab** - directory structure of your device memory. Importable files are usually stored in SDCARD folder.
- **Dropbox tab** - directory structure of your Dropbox folder
- **Remote file tab** - contains socket for inserting URL of a remote file stored in an Internet repository (Rapidshare, Mega, Mediafire etc.)

Import dialog

After selecting the file Locus Map analyses it and modifies the import dialog according to the content - the dialog can process points or tracks or both of them at once.
