About Points in Locus Map

Points in Locus Map, often referred to as **Points of Interest** or abbreviated **POIs** are georeferenced information packages displayed above the map. In Locus Map, there are **two main categories** of POIs:

- **User Points**
- **LoMaps POIs**

User Points

This category of points is handled as independent on map and is **added to the app by Locus user**. These points can be **downloaded** from database sources around the world (e.g. **geocaches from Geocaching.com**) or **imported** from your device. They can be **created** on the spot or **photographed**. They are **managed** in the Points manager, can be **stored** in folders, **grouped**, **sorted**, **filtered** and **edited** in many ways.

These points are referred to across the application as just “*points*”.

LoMaps Points of Interest

The other category of points are an integral part of **LoMaps**. They are a direct output of OpenStreetMap database and carry a lot of information about almost all point objects on the map,

beginning with *hill peaks, church monuments and other landmarks* and ending with civil facilities like *post offices, ATMs, gas stations etc.* These Points of Interest can not be created, deleted, renamed or otherwise manipulated but you can be guided or navigated to them, you can share them, copy them etc.

It is possible to display these points above any other map - just tap **Menu > More functions > Points of Interest(BETA)** and choose any category. However, it is necessary to have LoMaps of the same area downloaded.
