

Tips For Developers

On this page we would like to collect all nice and possible ideas on add-ons.

This collection has one main purpose. Because creating add-ons for already existing application like Locus Map is quite easy, and because our time possibilities are very limited, we want to offer some inspiration for freelance developers or for those, who start with developing for Android.

Routing service - OpenRouteService.org

OpenRouteService is another routing service based on OpenStreetMaps project.

Where to start

- Request permission from [OpenRouteService.org](https://openrouteservice.org) server.
- Implement it as a [RoutingService](#).

Additional links

- [Wiki documentation](#)
- Locus forum - [discussion](#)

Panoramio

Panoramio is a nice web service that collects images from all around the World together with their location. Thanks to their API it should be possible to create nice and simple add-on, that will display Panoramio images on a map.

Where to start

- Check [Panoramio API](#)
- Create basic add-on that will listen to [PeriodicUpdates](#).
- Receiver of updates should fetch data over Panoramio API. From these data, create a list of waypoints and display these points on running Locus Map application.

Additional links

- [sample code](#) for Periodic updates
- [sample code](#) to display points in Locus Map
