Corrupted SQLite Database Repair

SQLite databases on Android devices are very stable by definition. However, we have experienced that databases can be corrupted. This may be due to wrong closing the database or killing Locus app. The result is that Locus Map is not able open the database file or the file deletes itself - **this concerns both map files and points/track databases, all are SQLites**. Luckily sometimes it is possible to repair such a corrupted database.

How to

Following steps require working with the command line.

- Copy corrupted map file (or other sqlite database) from your device to PC
- Download sglite-shell from http://www.sglite.org/download.html
- Unpack it and place corrupted database file into the same directory as sqlite3.exe
- Start cmd and navigate to the directory with the corrupted file
- Run

```
echo .dump | sqlite3.exe name_of_map.sqlitedb > name_of_map_dump.sql
```

and then

sqlite3.exe -init name of map dump.sql name of map fixed.sqlitedb

Try to import the fixed map
