Navigate To...

Standard voice navigation as you know it from your car or other applications.

1. Select Target

Firstly, you have to **tell Locus where you want to go**.

Directly on map

The simplest and fastest (and the least accurate) way.

1. **hold your finger on the place on map you want to be navigated to**
2. a popup with address emerges, tap “>” and select **Navigate to**

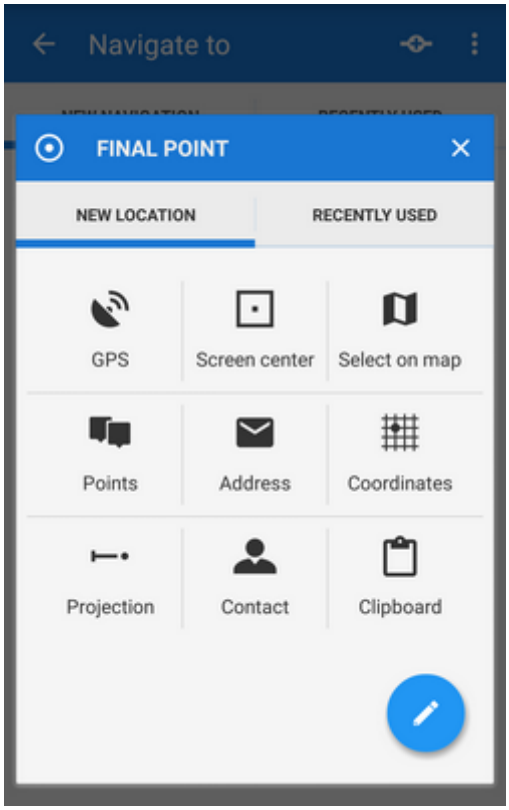

Other location options

When you need accurate or special definition of your target location, use **location selector**:

1. tap *Menu* > *More functions* > *Navigate to*

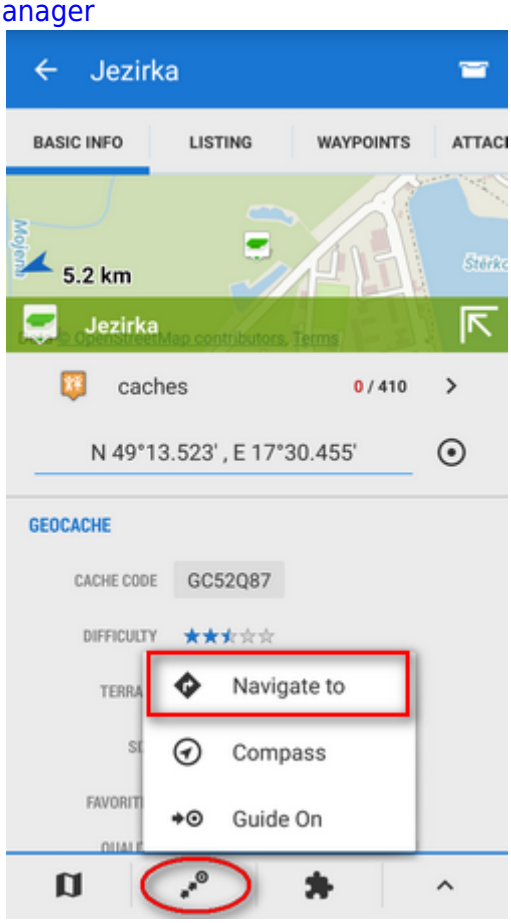

2. select **method of defining target** of your route:

Point from Data manager

Use e.g. in case you want to navigate to some geocache from your database:

1. select the point from Point manager

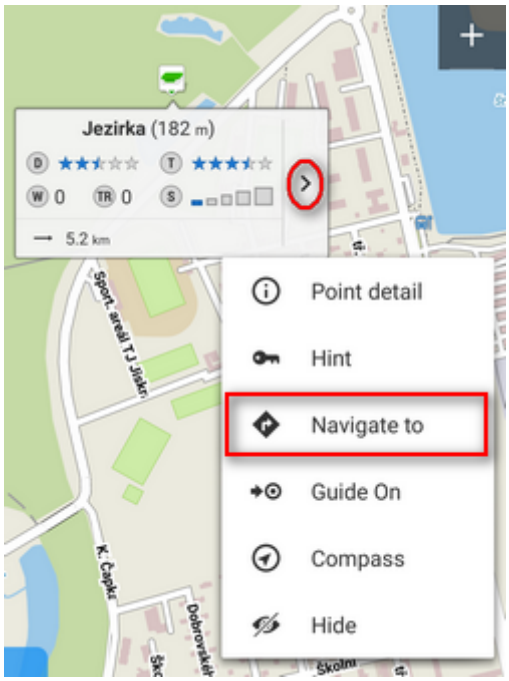

2. tap it to display the point detail screen
3. tap button from the bottom panel and select **Navigate to**

Point on map

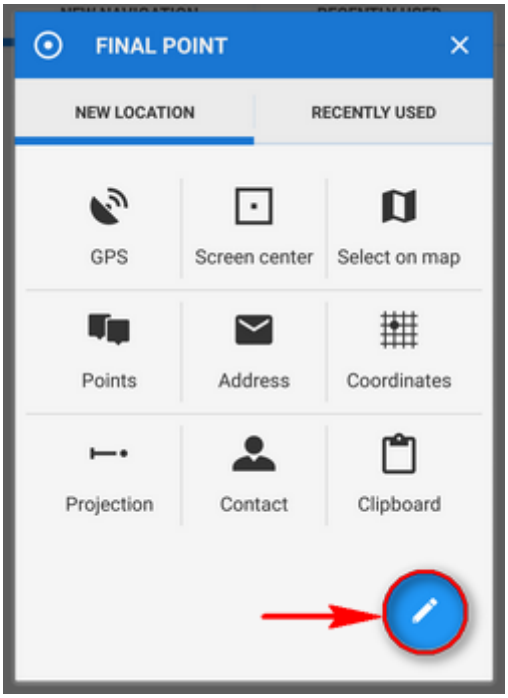

Similar to the first method but now you select directly some point of interest:

1. tap a point of interest displayed on the map (a geocache or some LoMap POI)
2. tap “>” on the point label and select **Navigate to**

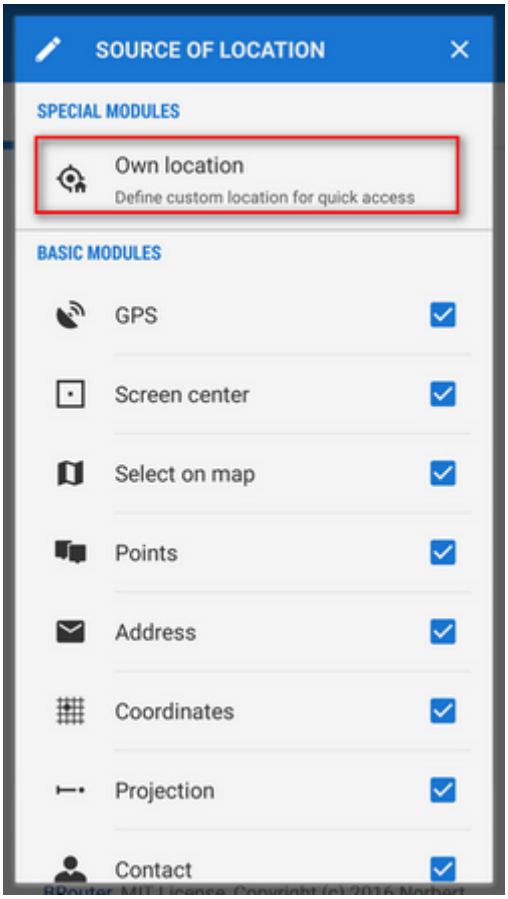

Own navigation target for repeated use

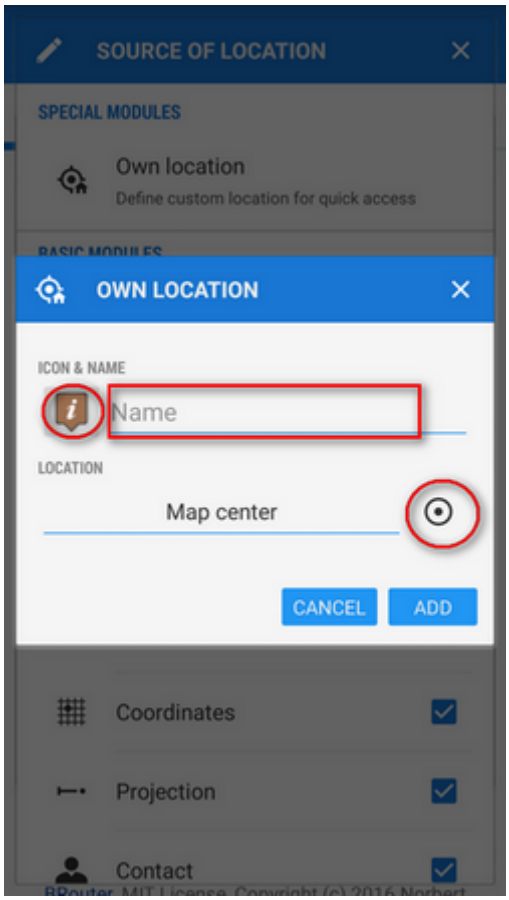

1. start **Navigate to** and tap :

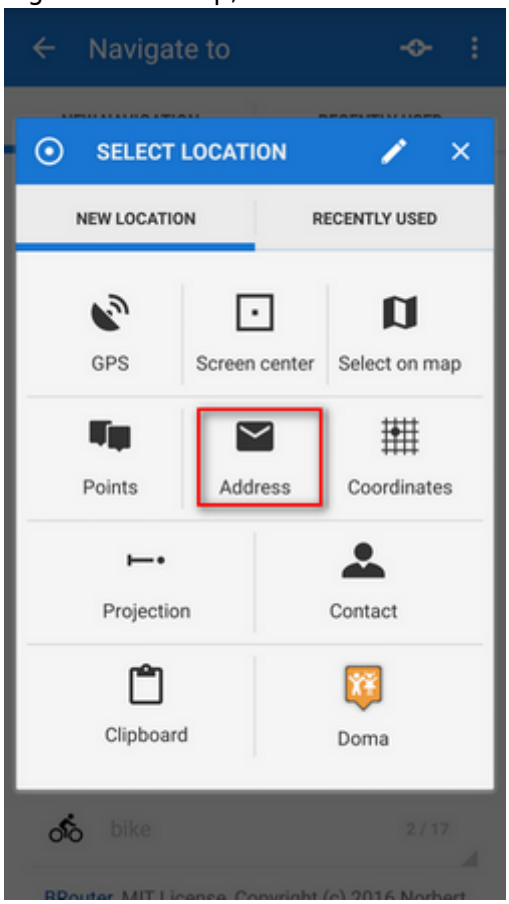

2. select **own location** in the next menu:

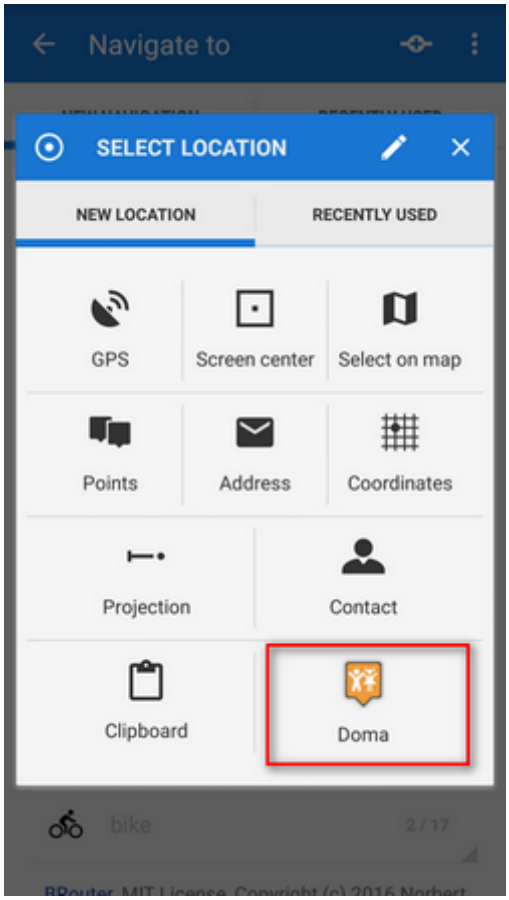

3. set the **icon** and **name** of the location (home, work, grandma...) and tap ⊙ to select method of defining the target:

4. **define your target** by showing it on the map, address etc.:

5. **confirm**. Your navigation destination appears among the location selecting methods:

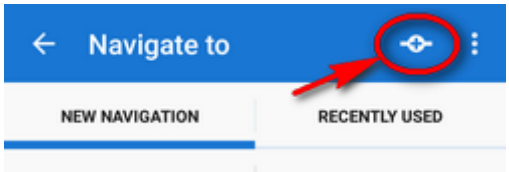

When you start navigation **next time, just select the target from the grid**.

Starting point of your route can be re-defined too, just tap ⊙ next to it and select location method.

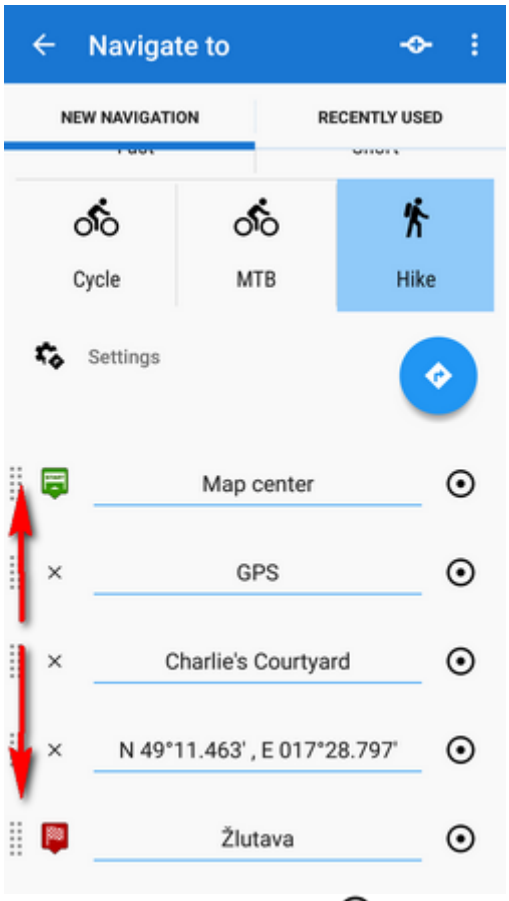

2. Add Via Points

You can insert up to three places you do not want to miss on your route:

1. tap ⊸ in the topbar

2. select via point **location definition** (map center, GPS, address...)
3. via points display **between start and final points** of your navigation route
4. you can **change order** of the via points as well as starting and final points by **dragging them up or down** on the left side

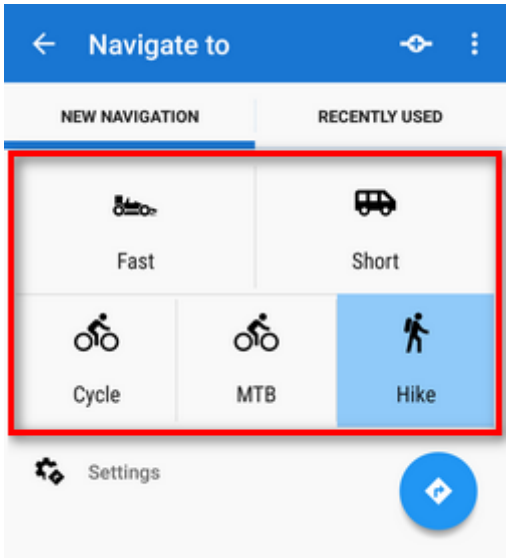

5. you can change names, location of the via points (tap ⊙) or remove them by tapping “x”.

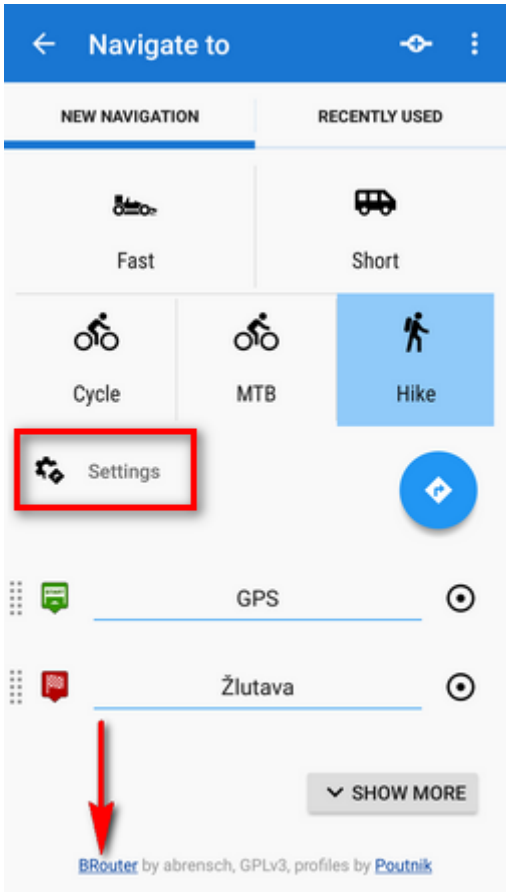

If you need more sophistically planned route, use Locus Route Planner!

3. Select activity or means of transport

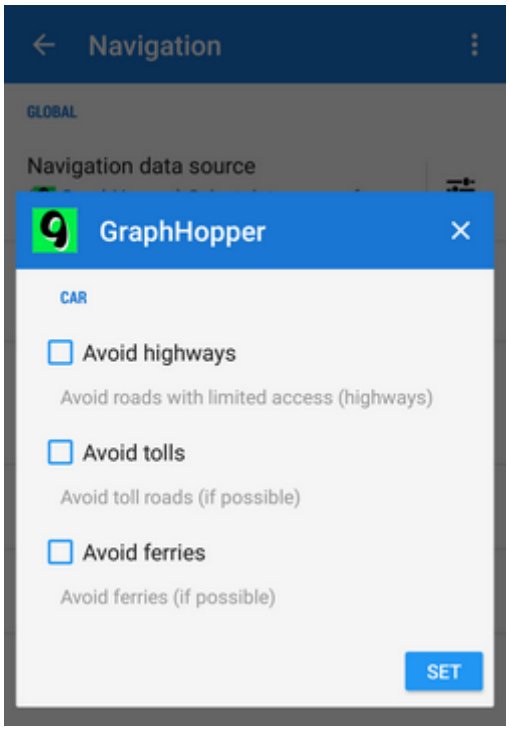

Next step is to choose **sports activity or means of transport** an route (aka navigation profile). The selection depends on used **routing services**.

Online routing services settings

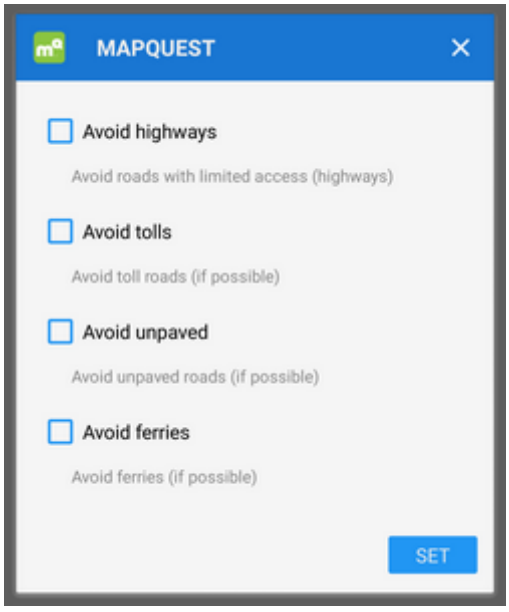

GraphHopper profile settings

Additional settings of GraphHopper profiles are relevant only to the 'car' profile.

MapQuest profile settings

Additional settings of MapQuest profiles are relevant only to the 'car' profile.

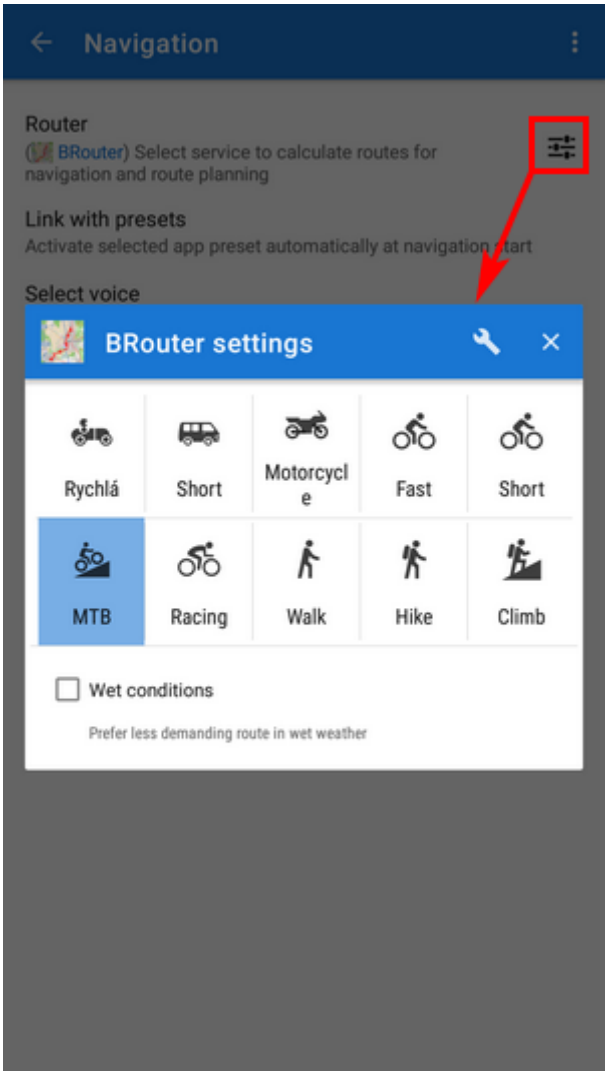

BRouter - offline routing service

Offline navigation and route planning in Locus is possible thanks to a **free** cooperating app **BRouter**:

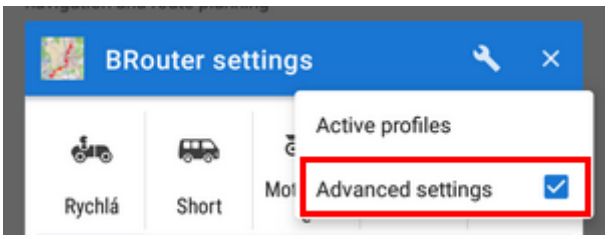

1. download it, install it and download routing data to it - start it separately and select **Downloader**
2. set BRouter as **default** router in **navigation settings**.

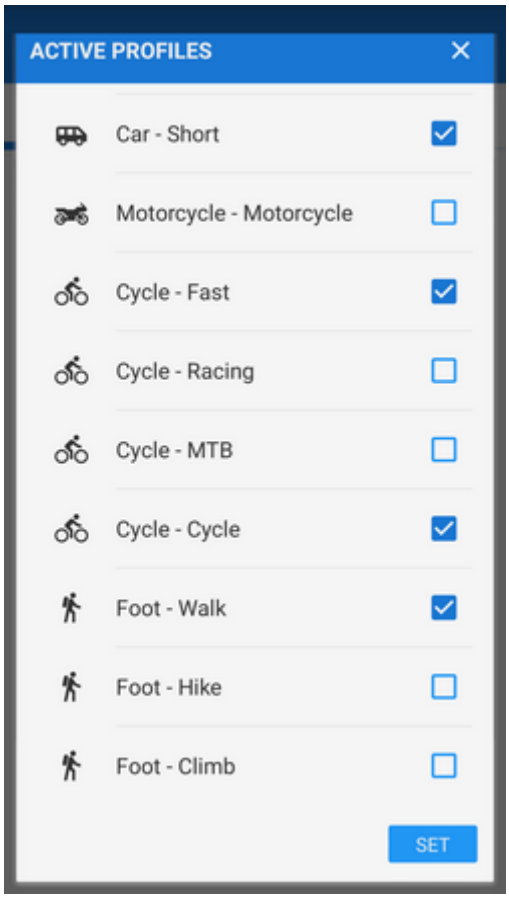

BRouter settings

BRouter offers much more sophisticated profile settings. Not only you can add more conditions relevant to various means of transport,

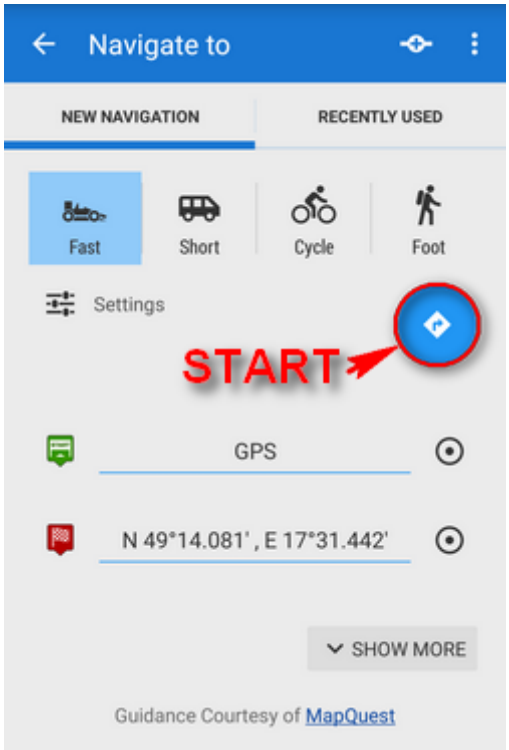

you can also change the profile selection:

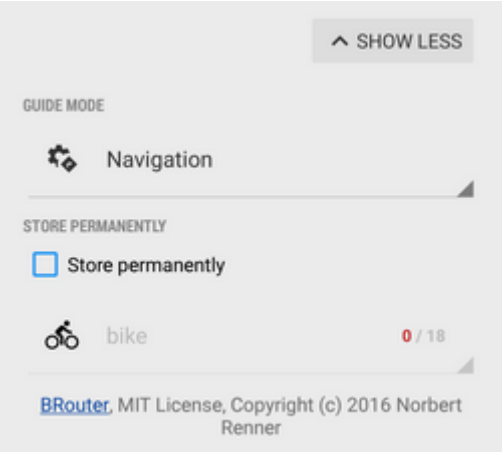

4. Start Navigation

Advanced options

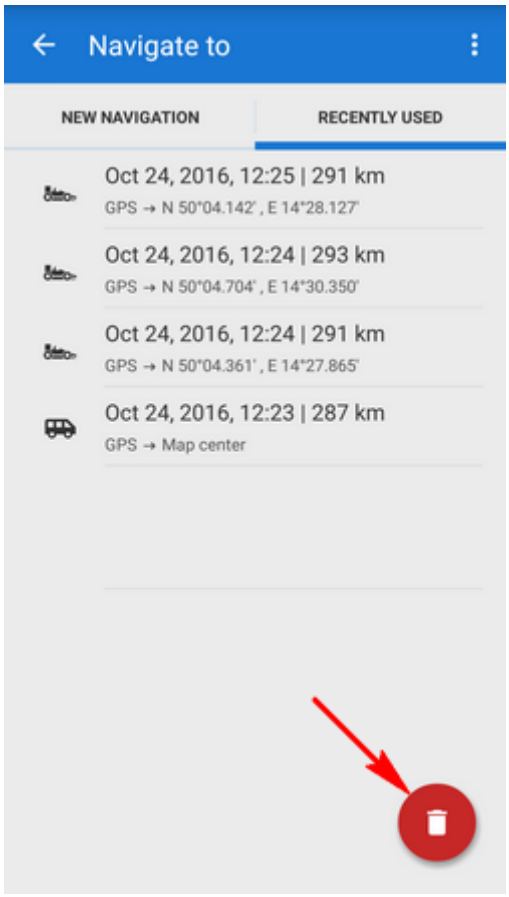

Show more button displays further setting options:

- **Guide mode** - fine-tune the way of navigation:
  - *Navigation* - full turn-by-turn navigation you are used to from your car
  - *Guidance (with commands)* - simplified mode with TTS direction changes notifications
  - *Guidance (no commands)* - the simplest way without any notifications
- **Store permanently** - if checked, you can store you navigation route to the device memory for later use. You can select a folder for it or create a new one.

Recently navigated routes

Go to the 'Recently used' tab. Tap one of the routes, select between navigation and guidance and tap to start.

If you want to delete the navigation history list, tap red .
