

# Image map calibration

---

## About

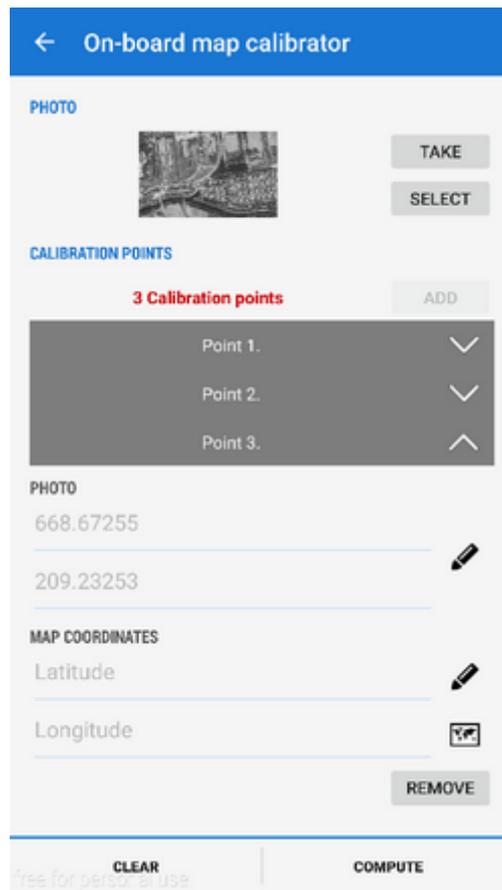

This feature enables calibrating an image of map and placing it over the active map. For example when you go to the ZOO or a park simply take a picture of its detailed plan displayed on a board at the entrance. After that you can calibrate the photo according to your background map and use it for your further navigation. **This option is available only to Locus Map Pro users.**

## 1. Get a map picture

- open the function in **Menu > More functions > On-board Map Calibrator**, a dialog appears
- tap **Take** to take a photo with your phone camera - the more quality camera, the better
- or **Select** to choose the photo from your device photo folder.

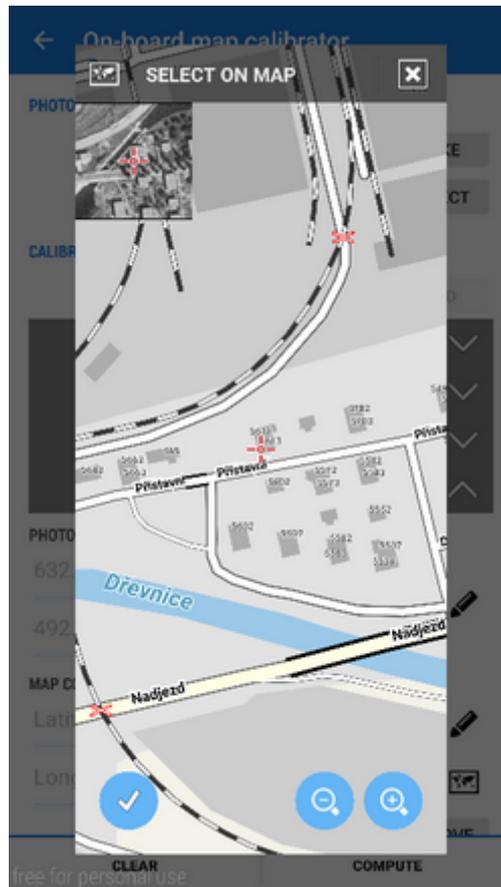

We recommend to **copy the image** from your PC/scanner/internet or a DSLR camera to your Dropbox or the phone photo folder (DCIM) before selecting it to get better results

## 2. Calibrate the map picture

- tap *Add* and choose a **distinct point** (a hill summit, crossroads etc.) on your picture
- tap  in *Map coordinates menu* and choose **the same point** on your background map
- repeat this procedure **4 times** - try to select points making a square. You can edit their positions by tapping  or remove them.

### 3. Generate your calibrated map

- when you are ready with your four points the status line **turns green** and the *Compute* button activates
- calibration points overview appears - indicates their **deviation**. When it is not large you can name the new map and proceed to its rendering

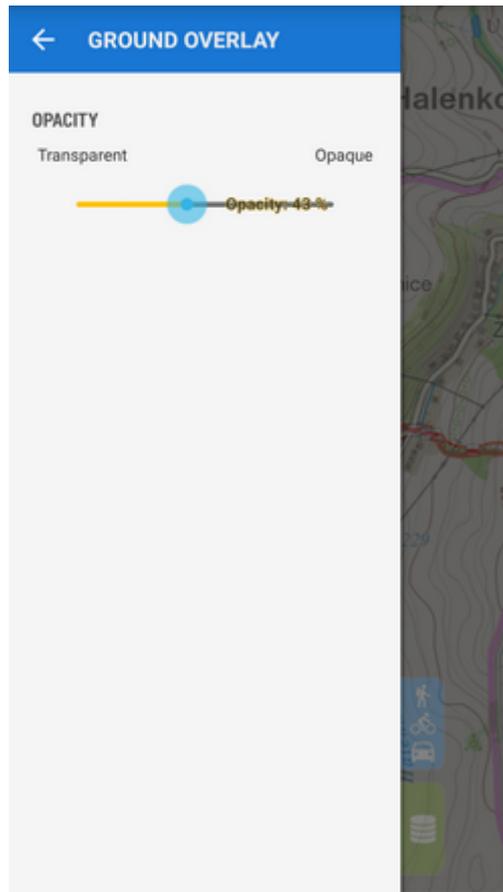

If you have chosen a huge picture, it is highly recommended to divide the map image into many small maps (tiles) bundled into one file.

### 4. Use the calibrated map

Your calibrated map appears now as an **overlay** and can be (de)selected in **Data manager > Items**

You can change opacity of the calibrated map by selecting it in the side item browser and moving the opacity slider:
