# Backup Manager

About

- Menu > More functions > Backup Manager

The Backup Manager enables one-time backup of all settings and important data in Locus Map or defines periodic automatic backups. The manager is also useful when transferring the application from one device to another.
Manual Backup

- **Backup all** - enables immediate one-time backup of all settings, points, tracks and other important data into one package. The **time stamp** is default as the package name but it is possible to change it. The package is stored into *Locus/Backup* directory.
- **Backup settings only** - creates the settings backup package. Useful if you use various properties sets.
- **Restore** - shows the last backup file content - user can select whole package or only a part to recover.
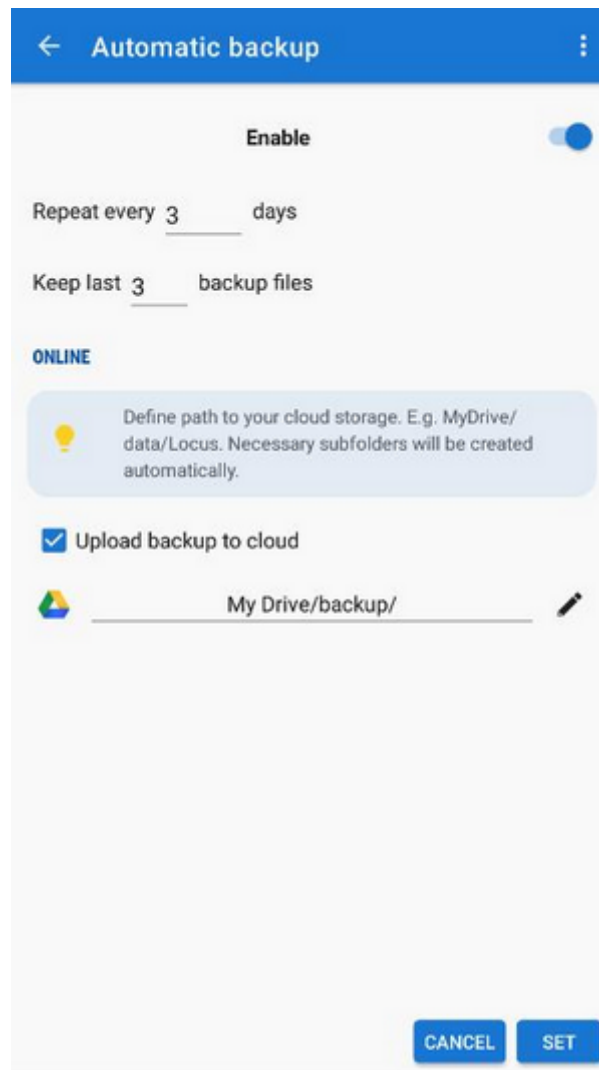

Backup sharing

After the backup file is created you can share it - **send it to Dropbox, email it, share it on social networks** etc. Just tap in the confirmation box:

Automatic Backup

Depending on previous settings there is initial **Enable** option to start the automatic backup or if the automatic backup has been set before, there are **Edit** and **Cancel** options. Automatic backup saves settings, points and tracks.

Edit opens automatic backup setting dialog:

- **Next backup** - date and time of the next backup
- **Notification** - check to let yourself be informed about the backup processed
- **Repeat** - repetition settings - frequency and number of stored backup files
- **Set/cancel** - confirms or aborts the action

Cancel deactivates automatic backup.
