

## GPS/Compass

---

The **GPS/Compass button/indicator** can be placed in one of the **Functions panels**. It indicates your **internal GPS status**:

-  - acquiring of location is **disabled**
-  - searching for location but valid location **not found yet**, location on the map is marked by an *orange circle*
-  - the same as above, but *Internal GPS Auto-off* is **enabled** (see more in [GPS settings >>](#))
-  - current location is **valid** (GPS is fixed), location on the map is marked by a *blue circle*
-  - the same as above, but *Internal GPS Auto-off* is **enabled** (see more in [GPS settings >>](#))

The **GPS/Compass button** switches on a separate two tabbed window displaying [GPS skyplot](#) and [Compass](#). When you **hold** the GPS/Compass button, a menu appears for a **fast switch of GPS status**.

## GPS

The first displays the **skyplot** - placement of monitored GPS satellites and other useful information like current *altitude, speed, GPS accuracy, current coordinates, number of fixed/visible satellites* and *time of the last GPS fix*.

### Legend

- *Circles* - satellites of U.S. Global Positioning System
- *Squares* - satellites of the Russian Glonass positioning system
- *Color* - signal quality (red - low, yellow - middle, green - high)
- *Height of bars* - signal to noise ratio

Tapping the skyplot or the button in the bottom **switches GPS on/off**.

## Compass

The other tab displays the **compass**, *azimuth*, *distance of your navigation target* and *tilt of the phone*. Lower line contains also fields for *time to next waypoint* active in navigation and *declination* value.

The compass ring displays current position of **the Sun** in the sky .

Tapping the tilting indicators opens a menu offering sensor calibration.

⋮

## Topbar menu

Contains switches of a few useful functions and settings:

- **Use hardware compass** - a shortcut to [the sensors settings](#) - switches to the built-in hardware compass. Hardware compass bearing is more suitable for slower speeds, e.g. walking, as it does not require movement to detect direction unlike GPS. GPS azimuth bearing is more suitable for car navigation due to magnetic components in the car.
- **Bluetooth manager** - switches to the [settings dialog of connected Bluetooth devices](#).
- **Altitude manager** - switches to the [altitude settings dialog](#)
- **GPS and location** - a shortcut to the [GPS and location settings](#)
- **Sensors** - a shortcut to the [the sensors settings](#)
- **System settings** - a shortcut to your device system settings of GPS and location
