

Image map calibration

About

This feature enables calibrating of an image of map and placing it over a background map. For example when you go to the ZOO or a park simply take a picture of its detailed plan displayed on a board at the entrance. After that you can calibrate the photo according to your background map and use it for your further navigation. This option is available only to Locus Map Pro users.

1. Get a map picture

- open the function in **Menu > More functions > On-board Map Calibrator**, a dialog appears
- tap **Take** to take a photo with you phone camera - the more quality camera, the better
- or **Select** to choose the photo from your device memory, from Dropbox etc.

We recommend to **copy the image** from your PC/scanner/internet or a DSLR camera to your Dropbox or the phone memory before selecting it to get better results

2. Calibrate the map picture

- tap *Add* and choose a **distinct point** (a hill summit, crossroads etc.) on your picture

- tap  in *Map coordinates menu* and choose **the same point** on your background map

- repeat this procedure **4 times** - try to select points making a rectangle. You can edit their

positions by tapping  or remove them.

CREATE NEW MAP

NAME

Name

SETTINGS

☒ Optimize map

Divide the map image into smaller maps bundled into one file. Highly recommended!

PARAMETERS

Deviation of point 1
23 m

Deviation of point 2
23 m

Deviation of point 3
13 m

Deviation of point 4
13 m

Create map from current configuration?

NO

CREATE

When it is not too significant you can name the new map and proceed to its rendering

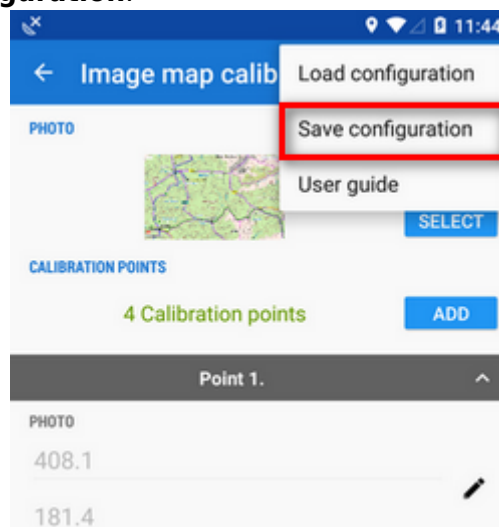

If you have chosen a big image it is highly recommended to check **Optimize map** to divide the map image into many small maps (tiles) bundled into one file.

Save the calibration configuration for later use

If you have **more map images of the same size and scale** to calibrate you can use one configuration for calibrating them all:

1. calibrate the first image
2. **save the calibration configuration:**

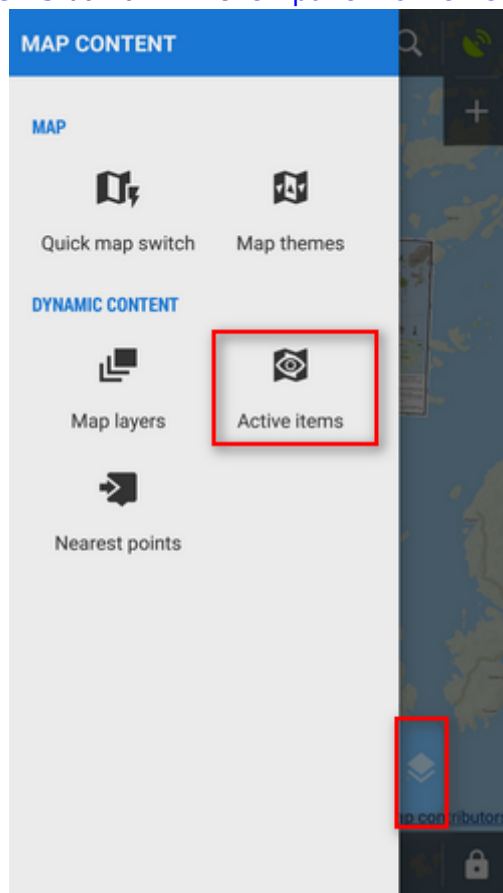

3. open the next image
4. calibrate
5. repeat ad hoc.

4. Use the calibrated map

Your calibrated map appears now as an **overlay**

and can be managed in **Map Items** box or in the **left panel Active items** tab.

You can change opacity of the calibrated map by selecting it and moving the opacity slider:
