Points Export

What is export for?

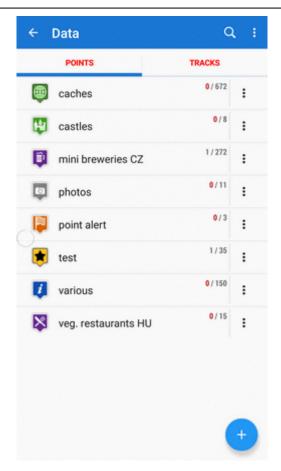

Points are exported to another mobile, to a desktop application or web service for further processing - displaying in a different environment, background, for editing etc.

Instructions:

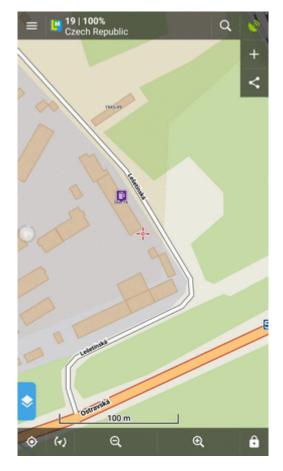

1. Select point/s

Single point

• **Points manager** - select folder > tap the point to open its detail > "more options" > Export

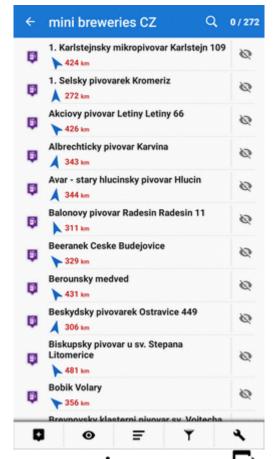

• Map screen - tap the point on map > tap its label to open its detail > "more options" > export

Group of points

• **Multiple points** - Points manager > open folder > tools > check points you want to export > export

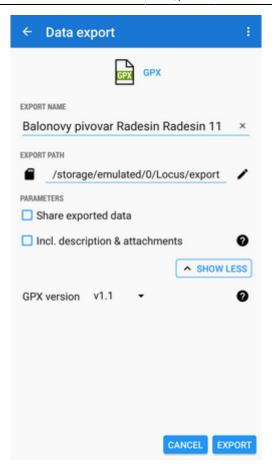

• Whole folder - Points manager > folder action menu > expor

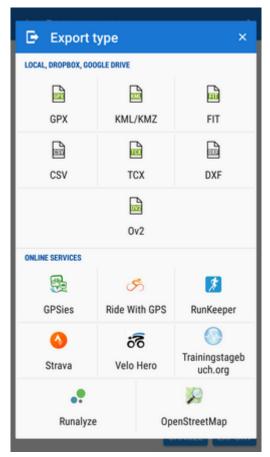

2. Set parameters and export

2024/09/19 01:42 5/7 Points Export

• **Export format** of the file is at the very top of the dialog. By tapping it you can change it into another one:

(only some file formats can be selected. The dialog is common with the track export so it contains also track file formats and web services. None of them accepts points)

- Export name the name of the export file, usually pre-filled according to the point/folder name. Can be edited.
- **Export path** define where to save the exported file. You can select local memory, Dropbox or Google Drive (both apps must be installed first).
- Parameters change according to selected export format:
 - **GPX** GPS eXchange format is an XML based text format used for handling points, tracks, and routes. Locus fully supports all valid tags. A more detailed description of GPX format is available on this Wikipedia page.
 - Export only visible exports only points actually visible on the map
 - Share exported data enables to share the export file in Dropbox or other services available in your device
 - *Incl. description&attachments* adds icons, generated descriptions and attachments and exports them into a subfolder
 - GPX version optional setting for experienced GPS device users
 - KML/KMZ Keyhole Markup Language is XML based plain text format with a really wide range of usage. Since the version 2.2 KML format is standardized by OGC so it is used by many web/desktop/mobile applications as well as by Locus Map. It is usable for export of both points and tracks.
 - parameters are identical to GPX export but one:
 - Incl. descriptions&attachments enables packing data into one KMZ file icons, photos etc.
 - **CSV** (Comma Separated Values) is a common, universal and relatively simple file format that is widely supported by many applications. Usable for export of both points and tracks. Parameters are just Export visible and Share.
 - **DXF** (Drawing eXchange Format) comes from CAD software. Usable for export of both points and tracks. Except for already mentioned parameters, it enables to:
 - Display altitude displays altitude of exported points as text information
 - Real (3D) altitude moves exported points into real height above the sea level and displays them in 3D
 - **OV2** TomTom format for POI database. The same parameters as CSV.

Export of Geocaches

When exporting multiple geocaches to a GPX file all of them are **checked if they contain complete information** (listing etc.). If they contain just basic info about coords, terrain, difficulty, they are **automatically updated** - export of geocaches takes a bit more time than in case of ordinary points.

If you want to avoid this updating, set your Geocaching4Locus addon so that it downloads all information about caches directly (Settings > Download > uncheck "Basic info only")

When the parameters are set, just tap the EXPORT button:
