

# Points Export

---

## What is export for?

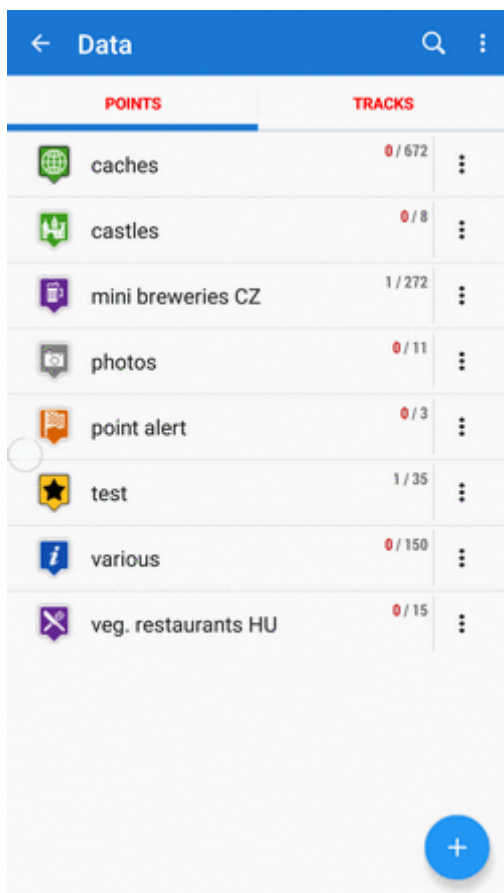

**Points are exported** to another mobile, to a desktop application or web service **for further processing - displaying in a different environment, background, for editing** etc.

**Instructions:**

## 1. Select point/s

### Single point

- **Points manager** - select folder > tap the point to open its detail > ^ "more options" >  export

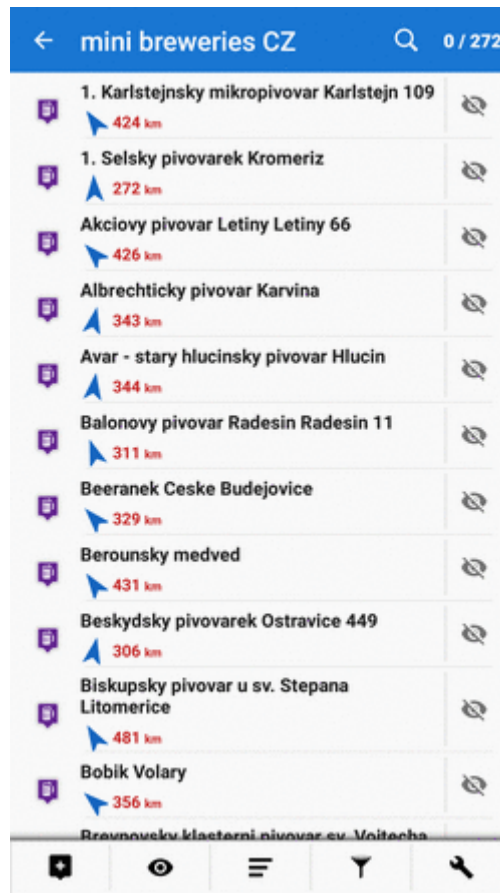

- **Map screen** - tap the point on map > tap its label to open its detail > ^ “more options” >  export

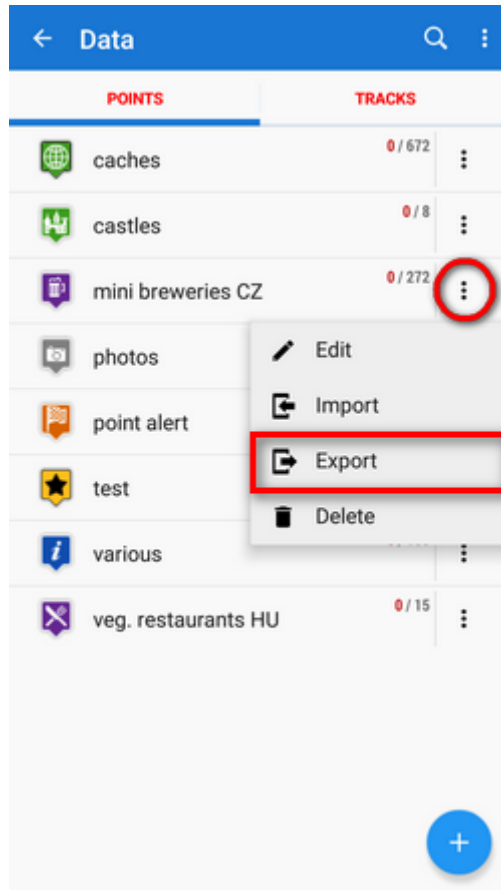

## Group of points

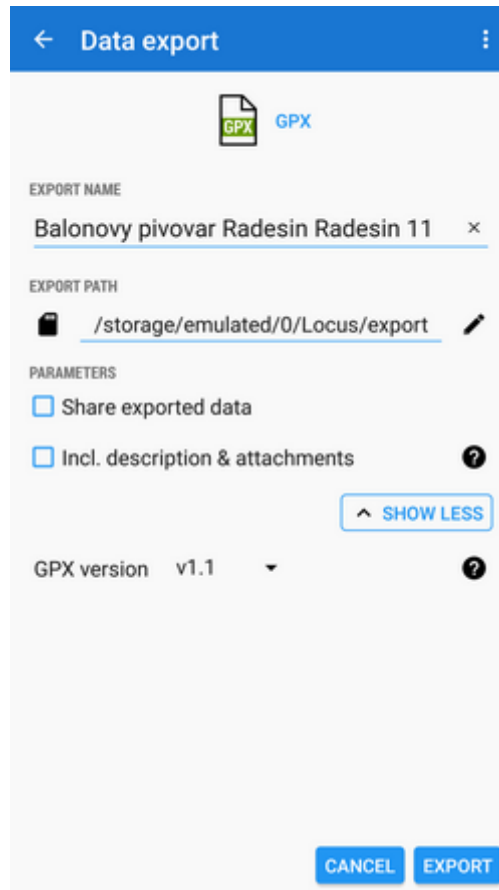

- **Multiple points** - Points manager > open folder >  tools > check points you want to export >  export

- **Whole folder** - Points manager > folder  action menu >  export

## 2. Set parameters and export

- **Export format** of the file is at the very top of the dialog. By tapping it you can change it into another one:

*(only some file formats can be selected. The dialog is common with the track export so it contains also track file formats and web services. None of them accepts points)*

- **Export name** - the name of the export file, usually pre-filled according to the point/folder name. Can be edited.
- **Export path** - define where to save the exported file. You can select local memory, Dropbox or Google Drive (both apps must be installed first).
- **Parameters** - change according to selected export format:
  -  **GPX** - [GPS eXchange format](#) is an XML based text format used for handling points, tracks, and routes. Locus fully supports all valid tags. A more detailed description of GPX format is available on this [Wikipedia page](#).
    - *Export only visible* - exports only points actually visible on the map
    - *Share exported data* - enables to share the export file in Dropbox or other services available in your device
    - *Incl. description&attachments* - adds icons, generated descriptions and attachments and exports them into a subfolder
    - *GPX version* - optional setting for experienced GPS device users
  -  **KML/KMZ** - [Keyhole Markup Language](#) is XML based plain text format with a really wide range of usage. Since the version 2.2 KML format is standardized by OGC so it is used by many web/desktop/mobile applications as well as by Locus Map. It is usable for export of both points and tracks.
    - parameters are identical to GPX export but one:
    - *Incl. descriptions&attachments* - enables packing data into one KMZ file - icons, photos etc.
  -  **CSV** - (Comma Separated Values) is a common, universal and relatively simple file format that is widely supported by many applications. Usable for export of both points and tracks. Parameters are just Export visible and Share.
    - used CSV tags: **pos** - an ID, **lat** - latitude, **lon** - longitude, **alt** - altitude (in meter?)

- time: time of point (in which timezone is the data exported?)

- speed: speed (what is the unit?)

- bearing: (what does it mean? what is the unit?)

- acc: accuracy (what does it mean? what is the unit?)

- heartRate: heart rate in bpm (beats per minute)

-  **DXF** - (Drawing eXchange Format) - comes from CAD software. Usable for export of both points and tracks. Except for already mentioned parameters, it enables to:
  - *Display altitude* - displays altitude of exported points as text information
  - *Real (3D) altitude* - moves exported points into real height above the sea level and displays them in 3D
-  **OV2** - [TomTom](#) format for POI database. The same parameters as CSV.

## Export of Geocaches

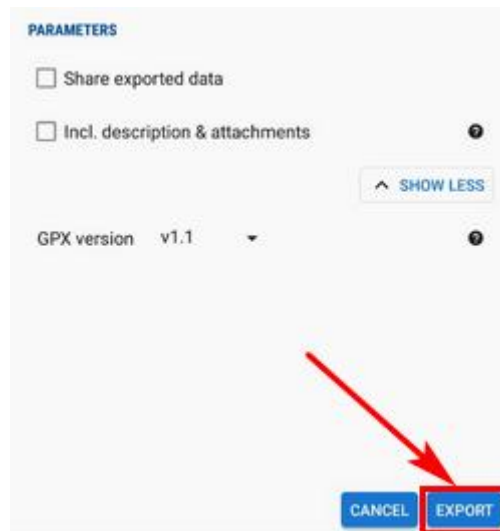

When exporting multiple geocaches to a GPX file all of them are **checked if they contain complete**

**information** (listing etc.). If they contain just basic info about coords, terrain, difficulty, they are **automatically updated** - export of geocaches takes a bit more time than in case of ordinary points.

If you want to avoid this updating, set your Geocaching4Locus addon so that it downloads all information about caches directly (*Settings > Download > uncheck "Basic info only"*)

**When the parameters are set, just tap the EXPORT button:**
