

Route Planning

About

Routes are strings of routepoints along which user is **guided** or **navigated** during his activity - hiking, biking etc.

Routes are **pre-planned, drawn on maps or imported** and put into navigation devices so that we can travel along their lines. **Tracks** that were recorded by you or someone else **can be turned into routes** when we need to navigate them.

Routes can be drawn **manually on the map** or **automatically** by an online routing service, offline routing app, PC software or web application. **Locus Map** provides several methods of creating routes:

- **Route planner** - tool for manual and automatic drawing of routes with routing service assistance
- **Changing tracks to routes** - using tracks as routes for navigation

Route planner

This tool can be switched on several ways:

- Menu > Route planner

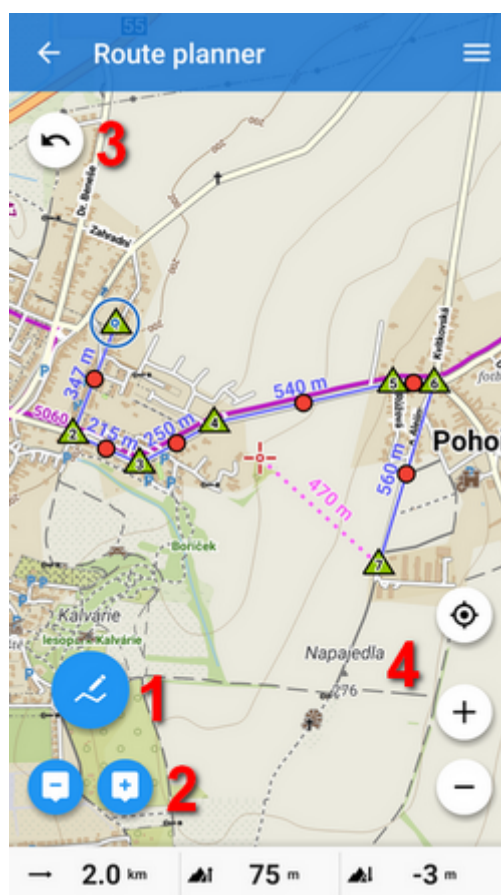

- Menu > Tracks >  > Route planner

- add function to the [Function panel](#) for quick launch

Route planner screen

1. **Drawing mode** - select among manual and automatic modes
2. **add/remove shaping points**
3. **back/forward** - move along planning process steps
4. **zooming and centering buttons**

- **Topbar** - contains **Route menu**
- **Bottom bar** - displays basic route stats (length, positive and negative elevation gain) and elevation chart button, sliding the chart up (only Locus Map Pro):

Route line

-  **shaping point** - basic point building the route, can be changed into **via point**.
-  **auxiliary point** - forms on the line between shaping points. Changes to a new shaping point when shifted.
-  **via point** - place through which you want to go during navigation.

The line between points stretches straight in case of manual drawing or runs along roads and paths in case of automatic drawing.

Drawing instructions

Set your drawing mode

- tap

and choose how to draw:

-  **manual mode** - only plain line stretches between shaping points:

This is useful for simple distance measurement or for areas not covered by routing data.

- , ,  etc. **automatic mode** - line calculated by a routing service renders between shaping points:

The shape of the line depends on selected mode - car routes run along roads, walking routes along paths etc. The automatic modes are provided by **routing services**. Some of them work online, some [offline](#) and you can set them after tapping . More info at [Navigation settings](#).

Offline automatic route planning

Download and install free co-application **BRouter**. Download also offline routing data of the area you are planning the route through. BRouter appears among other routing services in Locus [navigation settings](#). Set it as default.

- **Include navigation hints** - when checked, Locus creates also direction commands related to the new route which can be used for voice navigation.

Add shaping points

The route is built by **shaping points**  added on map:

- by **tapping**  (points are added on the **cursor position**)
- by **tapping directly on map** (this option can be turned off in the route menu)

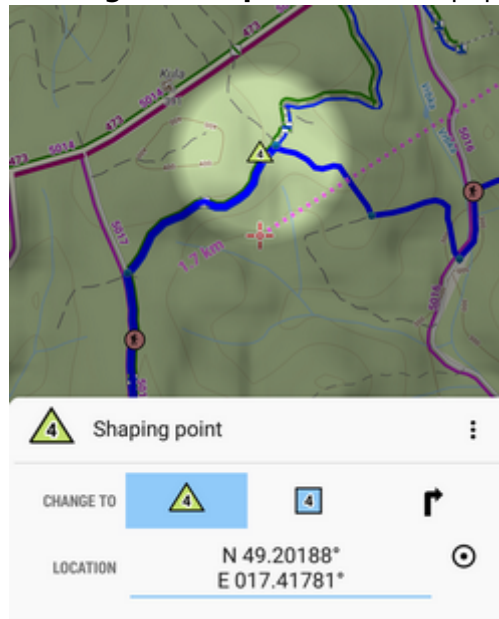

The route line, rendered between shaping points, contains also **auxiliary points** . Both shaping and auxiliary points can be **moved on map** and the route is **immediately re-rendered** accordingly. By moving an auxiliary point you change it into a shaping point and new aux points are created in between.

Add via points

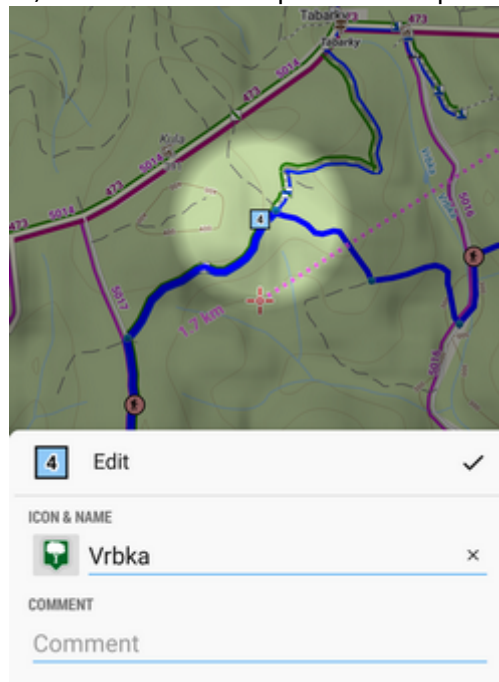

Via points are places you want to go through when **navigating the route** - the voice navigation will notify you of them and in case of route recalculation the via points are not detoured.

Via points can be created out of shaping points:

- tap a shaping point and select **Change to via point** from the popup label:

- **rename** the via point (optional) and confirm. Via point in the planner:

- after saving the route the via point is **marked by an icon**:

By moving a via point on map in route planner it changes back to a shaping point.

Add LoMap POIs

[LoMap dynamic points of interest](#) can be added to your route too:

- tap a POI on map
- tap “+” on its label
- select where to put the POI in the route - at the start, end or inside:

- when you select to add the POI at the end:

- when you select to add the POI inside the route:

Add your own points

Your own interesting places or downloaded geocaches can be added to your route:

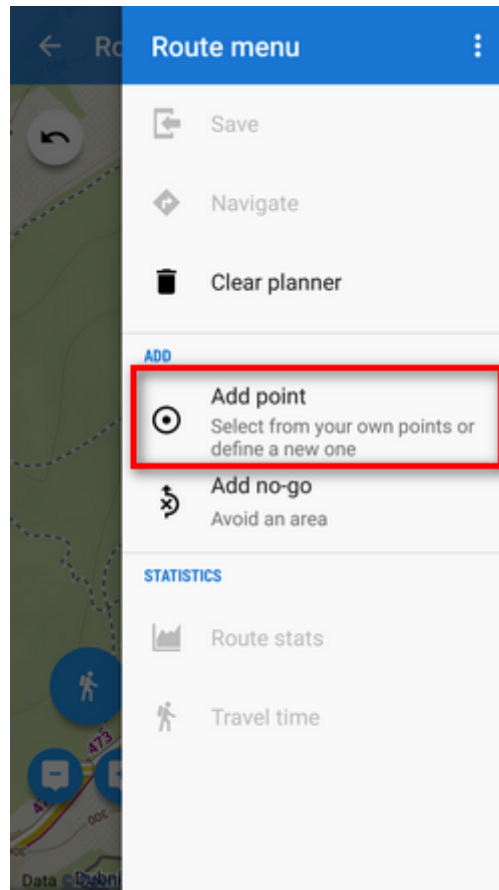

- display your selected **points on map** (Menu > Points > select whole folder or individual points)
- add them to your route **the same way as LoMap POIs** (see above):

Add individually defined point

Define a new point by an address, coordinates, projection etc. and add it to your route.

- open **route menu** from the topbar:

- tap **Add point** and select method of your new point definition from the [location selector](#):

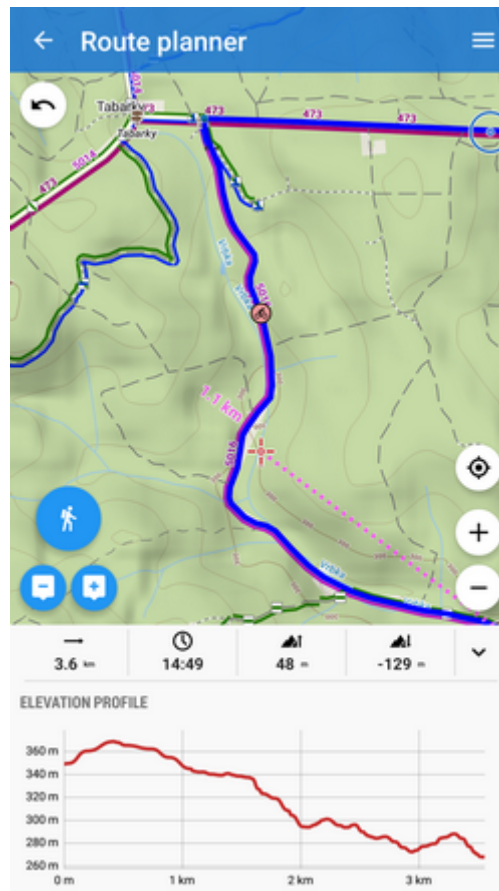

Undo, re-do, remove points

- to **remove last added shaping point**, tap 
- to **reverse all edits** (adding points, moving them), tap **back button**(3)
- to **repeat reversed steps**, tap **forward button**(3)

Check route stats and travel time

- **quick check the elevation profile** of the route on the chart sliding from the screen bottom (only Locus Map Pro):

The chart dynamically changes according to the your route edits (adding points, moving them...)

- check **more detailed stats** - Route menu > Route stats:

- check route **Travel time** - Route menu > Travel time:

Select the route **activity** - 3 types of walk, 9 types of bike and two of cross-country skiing. The time is calculated from the distance, estimated speed and elevation gain per hour:

Instant navigation

You can start navigation along the planned route right from the route planner:

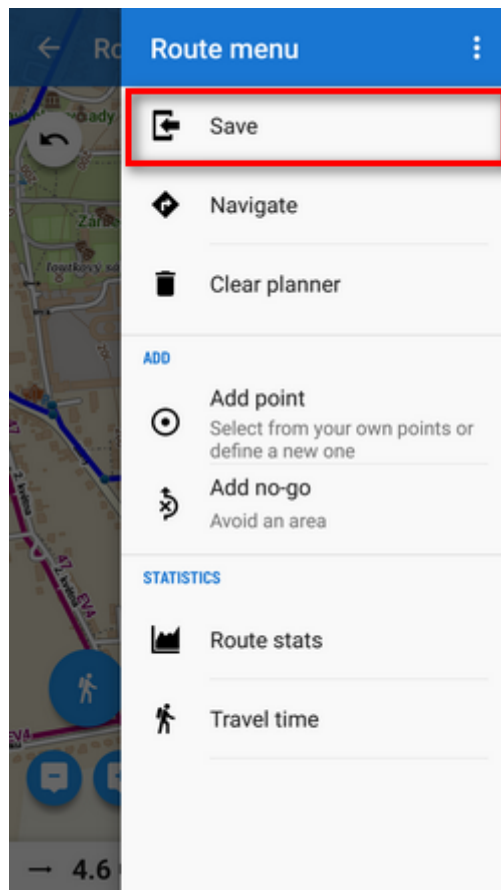

- open **route menu**
- tap **Navigate!**

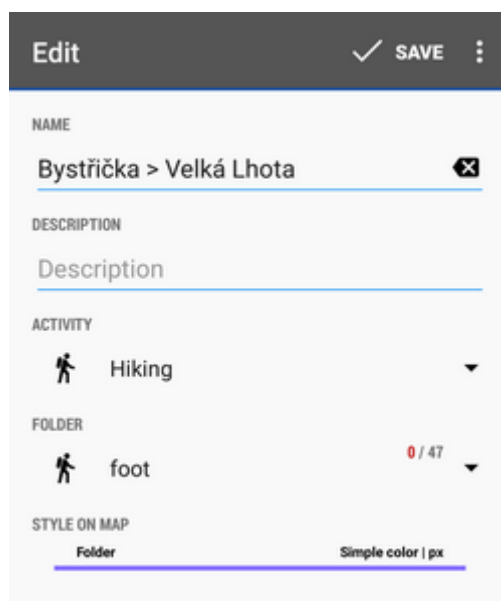

Save route

When you are done with all edits, **save your route!**

- open **route menu**

- tap **Save route**

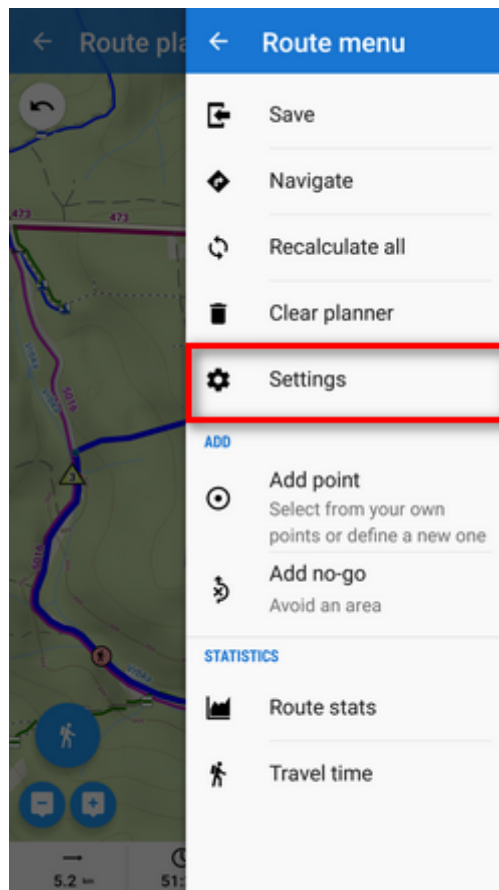

- add **name** of the route (optional - Locus usually inserts names of the route start/end places automatically)
- add **description** (optional)
- set **activity** - good for overall statistics
- select **folder** - tell Locus where to store the route
- set **style** - color, thickness, pattern... Usually it is not necessary, the folder style is pre-selected.

If you are dissatisfied with your planning or for whatever reason want to abort all planning, tap **Clear planner** in the route menu:

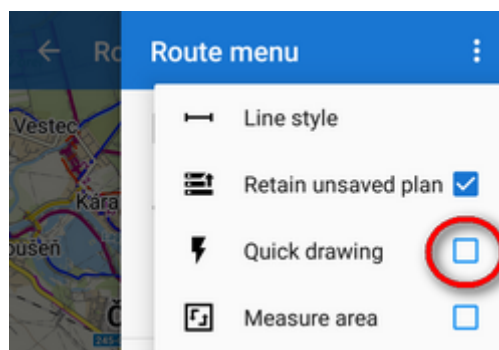

Auxiliaries

Route menu topbar contains a **submenu of auxiliary options**:

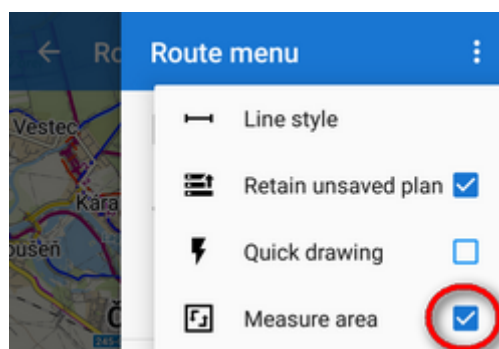

Quick drawing

To **turn off** adding shaping points by tapping the map screen, uncheck this option.

Measuring area

Do you want to measure area of your property? Check this option, Locus will color the area on map

and display the area value in the bottom bar:

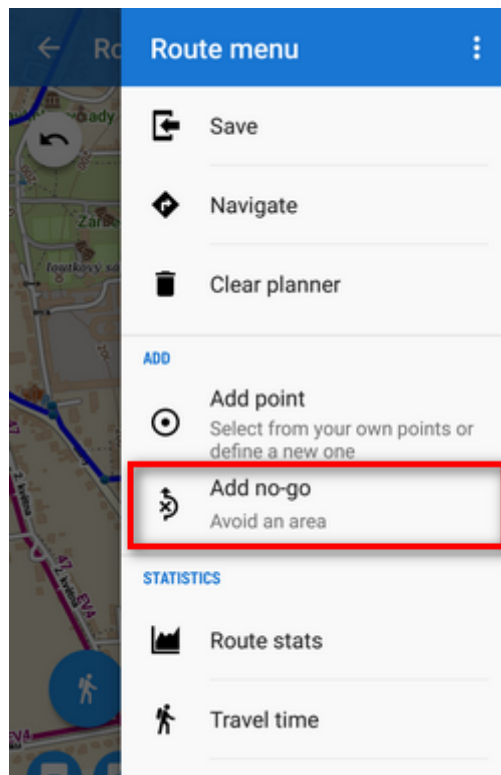

Measuring areas works correctly in manual mode only!

Route width

Width (and visibility) of the planned route can be set by a slider:

Using tracks as routes

Tracks can be turned into routes when they are intended for navigation or guidance:

- select track in data manager or tap it on the map
- select **Navigate** or **Guide On** or **Guide On reverse**
- [more about navigation along a route >>](#)
- [more about guidance along a route >>](#)
